Changes to Wireframe

Overall, the end prototype didn't differ too much from the initial wireframe. The most notable changes are the removal of the open/close arrow on each term on the home page and it's replacement with the edit icon. Since I used CollectionViews (which in hindsight I wish I hadn't) collapsing the view resulted in numerous problems, and ultimately wasn't worth the effort. The edit button is also a lot more useful. Originally editing the term would occur by clicking it, but that was difficult to show to the user.

Courses cannot be deleted on the home screen or term screen. They must be deleted on their own screen. This was partly due to the fact that adding deletion from those areas was a lot harder than doing it in the actual course screen, but it also saves the user from accidentally deleting something.

I also changed how and where dates get displayed on the term. Doing it the way I have it in the wireframe resulted in really compact, difficult to read courses. Now the dates are under the instructor name, which is a lot more readable.

Lastly, I changed how notifications were to be displayed. Now it is simply a toggle of whether or not you want that course or assessment to notify you when the end date is today. The reason for this change was honestly because it was easier. The original method would have required me to deal with calculating length of months in relation to the end date and chosen amount of days in advance for the notification.
